

Pedi Clinic

App features and screens: a reference for redesigning the app with AI design tools (Google Stitch, Figma Make and similar)

This document describes **what the app does today**: every role, screen, piece of data, action, state and rule. It is meant to be given to a design tool together with a prompt, so that new designs keep the same product and flows and change only the look and feel.

Written from the codebase as of 27 Sep 2026 (commit 4144de1). Source file: `dev-only/docs/APP_FEATURES_FOR_DESIGN.html`.

Contents

1. How to use this document with a design tool
2. The product in one page
3. Design constraints the redesign must keep
4. Current visual language (what exists today)
5. App map: roles, navigation and screens
6. Parent screens
7. Doctor screens
8. Pharmacist screens
9. Owner screens
10. Shared states, statuses and notifications
11. End-to-end flows
12. Do not add: things the app deliberately doesn't have
13. Ready-made prompts

1. How to use this document with a design tool

AI design tools tend to invent features, screens and flows when a prompt is vague. To stop that:

1. **Attach this PDF**, or paste the section for the screens you're designing, and tell the tool that this is the source of truth for features and content.
2. **Design one role at a time** (Parent, then Doctor, then Pharmacist, then Owner), and ideally one screen or flow at a time. Each screen below lists its purpose, content, actions and states.
3. **Say what may change**: colours, type, spacing, illustration, iconography, card styles, motion and layout details inside a screen.
4. **Say what must not change**: the list of screens and tabs, the steps in each flow, the data shown, the button labels for key actions, and the rules in section 3.
5. **Ask for every state**: loading, empty, error and success, plus the special states listed per screen (for example the token screen's six statuses).
6. **Check the output** against section 12 ("Do not add"). Common inventions to reject: estimated wait times, chat, online payment, doctor ratings, symptom pickers, and cancel or reschedule buttons for parents.

Words that matter. The product speaks to **parents** about their **children**. Prefer "child" over "patient" in new copy. (A few current strings still say "patients ahead of you" and "Patient history"; a redesign may keep or fix those.) Currency is Indian rupees (₹), locale en-IN, timezone Asia/Kolkata, English only.

Section 13 has ready-made prompts for each role.

2. The product in one page

Pedi Clinic is a phone-first, installable web app (PWA) for one pediatric clinic: one pediatrician, about 20 children a day, and an in-house pharmacy. It replaces the paper token and waiting-room shouting.

- **Parents** sign in with their phone number, add their children, **check in** to get a numbered **token** for today, and watch a **live queue** from their phone. The app notifies them when they're 3rd in line and when it's their turn. Afterwards they see a **visit summary** with the photographed prescription, the fee paid and any follow-up date. They can also **book appointments** (a session on a day up to a week ahead).
- **The doctor** runs the day from a phone, tablet or front-desk laptop: calls children from the queue, photographs the handwritten prescription, records fees and how they were paid (cash, UPI, card or split), sets follow-ups, opens booking sessions and looks at analytics.
- **The pharmacist** sees each completed visit instantly, reads the prescription photo, picks medicines and dispenses them (stock is deducted automatically), and manages stock.
- **The owner** (the product team, not clinic staff) sees app rating, install and notification adoption, and app-versus-walk-in usage.

WHO USES IT, AND WHERE

Role	Sign-in	Context
Parent	Mobile number + 6-digit SMS code	On their own phone: at home, travelling to the clinic, or in the waiting room with a child on their lap. Often one-handed and distracted. Mixed tech comfort. May open the link from WhatsApp.
Doctor	Email + password	Between consultations, in a hurry. Phone most of the time; sometimes a tablet or a laptop at the front desk.

Pharmacist	Email + password	At the pharmacy counter, on a phone or tablet, with the parent standing in front of them.
Owner	Email + password (separate login)	The product team checking adoption, occasionally, usually on a laptop.

Tone: calm, warm and reassuring, never clinical or alarming. Parents are anxious about a sick child; the queue screen should make waiting feel under control.

3. Design constraints the redesign must keep

Platform and layout

- **Mobile-first, not mobile-only.** Every role must work well at 320–430 px wide with no sideways scrolling, and also on tablets and laptops.
- **Navigation adapts to width:** a **bottom tab bar** on phones, a narrow **icon rail** on the left on tablets, and a full **sidebar** with the app name (and Sign out at the bottom) on laptops.
- **Sheets, not small dialogs:** secondary tasks (add child, add walk-in, search, complete visit, dispense, child history) open as a **full-screen sheet on phones** and a **right-hand drawer** from tablet width up. Clicking outside or pressing Escape closes the drawer.
- **One primary action per screen, pinned to the bottom** (for example "Check in", "Get token", "Book appointment") in a bottom dock that sits just above the tab bar on phones.
- **Card grids** use 1 column on phones, 2 on tablets and 3 on wide screens.
- Respect notches and home indicators (safe areas).

Touch and accessibility

- Touch targets at least **48 px**. Pinch-zoom is never disabled.
- Status is never shown by colour alone; each status also has a text label.
- Light theme by default; **dark mode follows the phone's setting**. Designs should include both.
- Motion is subtle and fast, and turns off for people who choose reduced motion.
- Toasts (short confirmations and errors) appear at the **top centre**.

Every screen needs these states

- **Loading:** skeleton placeholders in the shape of the content (never a blank screen or a lone spinner).
- **Empty:** an icon, a short title, one helpful sentence and usually one action (the copy for each screen is given below).
- **Error:** "Couldn't load this" with the reason and a **Try again** button.
- **Offline:** a slim "You're offline" banner; live screens keep showing the last data and catch up when the connection returns.
- **Success:** a toast, for example "Visit completed for Aarav" or "Dispensed — ₹340".

The centrepiece

The **parent's token screen** ("Your queue") is the visual heart of the product: a very large token number, a clear status colour, "Now serving" and plain, reassuring copy. Design this screen first and give it the most care.

Real content, no fake data

All data comes from the clinic's database. Designs may use sample Indian names (for example Aarav, Diya, Kabir, Ananya), realistic ages (such as "2 years, 3 months, 5 days"), 10-digit Indian mobile numbers and ₹ amounts from ₹0 to about ₹2,000.

4. Current visual language (what exists today)

This is the design system the redesign replaces. Keep the **meaning** of these tokens (one calm primary, one warm accent for the most important action, fixed status colours); the exact values can change.

Token	Today	Used for
Primary (teal)	 #23716d (600)  #eff9f8 (50)	Buttons, links, active tabs, waiting token, selected chips
Accent (coral)	 #f2703a (500)	Used sparingly: the main action on a screen ("Check in", "Get token", "Complete visit", "Book appointment"), the "It's your turn" state, badges and the "someone's waiting" dot
Neutrals	 warm grey #fafaf9 →  #1a1917	Warm-tinted greys, chosen so the app doesn't feel cold or clinical
Status: waiting	 neutral grey	Queue and visit statuses; these must read at a glance
Status: called	 coral	
Status: in consultation	 teal	
Status: completed	 green #2f9e6e	
Status: skipped	 amber #d69300	
Status: removed	 red #c24444	
Chart series	   blue, orange, green	Analytics charts only; always with a legend and a "Table" toggle
Font	Nunito (self-hosted)	Rounded, friendly sans. Any replacement must be self-hostable, with no request to a remote font service at runtime.
Radii	8 / 12 / 16 / 24 / 32 px	Generously rounded cards and buttons
Shadows	soft, low contrast	Cards float gently; nothing heavy
Token number	96 px, bold, tabular figures	The giant number on the token screen
Icons	Lucide (outline)	One icon set across the app

5. App map: roles, navigation and screens

Parent (route /)

Tabs: Home · Appointments · Last visits

- Sign in (mobile number → 6-digit code)
- Your name (first sign-in only)
- **Home**
 - Add child / Edit child (sheet)
 - Notifications list (bell)
 - Know about your doctor
- Check in → **Your queue** (token screen)
- Visit summary (+ prescription viewer, rating)
- **Appointments** → Book an appointment
- **Last visits**
- Overlays: install popup, notification prompt and banner, "App installed" cover, offline banner

Pharmacist (route /admin)

Tabs: Feed · Stock

- Staff sign in
- **Pharmacy feed** → Dispense (sheet)
- **Stock** → Add medicine, Restock (sheets)

Doctor (route /admin)

Tabs: Queue · Appointments · History · Notification · Analytics · Availability

- Staff sign in
- **Queue**
 - Search children (sheet)
 - Add walk-in (sheet)
 - Child history (sheet)
 - Complete visit wizard (sheet, 5 steps)
- **Appointments** (sessions and who booked)
- **History** → patient timeline (sheet)
- **Notification** (inbox, unread badge)
- **Analytics:** End of day · Trends
- **Availability** (open and close sessions)

Owner (route /owner)

- Team sign in (separate)
- **Owner dashboard** (single page)

Tab badges: the doctor's *Queue* tab shows a small coral dot, live from any screen, whenever anyone is waiting. The *Notification* tab shows an unread count (9+ max). The parent's bell icon shows an unread count too.

Six doctor tabs is a lot for a phone tab bar, and it is a known pain point. A redesign may regroup them (for example with a "More" tab) but must keep all six destinations reachable, with Queue first.

6. Parent screens

6.1 Sign in / (signed out)

Purpose: get a parent in with only their phone. There are no passwords.

- Step 1: title "Pedi Clinic", subtitle "Check in for your child's visit and follow the queue from your phone.", a **Mobile number** field (number pad, 10 digits exactly; shows an error for 9 or 11 digits or letters), and a **Send code** button (disabled until valid).
- Step 2: "Enter the 6-digit code we sent to +91...", a **Verification code** field (auto-fills from SMS), **Verify**, and "Use a different number".
- States: sending or verifying (button spinner), wrong code or network error (inline under the field).
- In a browser tab, the **install popup** (6.12) opens on this screen too, and the small install banner sits below the form. The installed app doesn't show either.

6.2 Your name first sign-in only

"What should we call you?", with the note "The doctor sees this alongside your child's details." It has one field (**Your name**) and a **Continue** button. If the doctor had already added this phone number as a walk-in, the parent's children and past visits are attached to their account automatically.

6.3 Home /

Purpose: the parent's base: which child is in today's queue, their children, and the way to check in.

TOP TO BOTTOM

1. **Header:** "Pedi Clinic", a notification **bell** with an unread count, and Sign out (icon on phones; in the sidebar wider up).
2. **Install / notifications card:** see 6.12; only appears when relevant.
3. **Today's tokens** (only if any child is in today's queue): one card per token with a square token-number tile, the child's name and a status pill. Tapping it opens *Your queue*. Updates live.
4. **Your children** with an + **Add child** link. Each child card shows the name, **exact age** ("2 years, 3 months, 5 days"), a pencil to edit, and, while in the queue, "Token 7 · Vaccination" plus a **"Currently in queue"** label. Child cards have no check-in button of their own.
5. **Bottom dock** (always pinned to the bottom): a **"Know about your doctor"** link; the "Enable notifications for live queue alerts [Turn on]" banner (only while undecided); and a wide coral **Check in** button (only when at least one child exists).

STATES

- No children: empty state "No children added yet", "Add your child's name and date of birth to check in.", button **Add your first child**.
- Loading skeleton; error with Try again.

6.4 Add child / Edit child sheet

- Fields: **Child's name** and **Date of birth** (a date, not an age; can't be in the future). The hint shows the live result: "Age today: 3 years, 2 months, 4 days".
- Button: **Save child / Save changes** (disabled until valid and changed).
- Edit only: a delete area. "Added by mistake? Deleting removes Aarav and any upcoming bookings. A child who has already visited the clinic keeps their records and can't be deleted." It uses a **two-tap** confirm button: "Delete Aarav" → "Tap again to delete Aarav".

6.5 Check in /check-in

Purpose: get today's token, **only inside the clinic**: scan the QR at reception, then two choices, *who* and *why*.

1. **Scan the QR code at reception:** the camera opens straight away, full width, with a scanning frame and "Point your camera at the QR code at reception. It scans by itself." Nothing else is shown until a scan succeeds. States: opening the camera; "That's not the clinic's check-in QR code"; camera access off (steps to allow it, **Try again**). After a scan: a green "QR code scanned — you're at the clinic" line above the choices.
2. **"Who is visiting?":** selectable child cards. A child already in the queue is shown but disabled, labelled "Currently in queue". With one child available, it's pre-selected.
3. **"Reason for the visit":** two large option cards, **Vaccination** and **General checkup**. There's no free-text field and no symptom list.
4. Pinned coral button: **Get token** (disabled until both are chosen). On success, the app goes straight to *Your queue*.

SPECIAL CASE: THE CHILD HAS AN UPCOMING BOOKING

In place of the reason picker, a highlighted card asks: **"Are you coming for the same reason you booked your upcoming appointment?"** It gives the booking details (child, reason, day and time) and two buttons: **Yes, same reason** (gets the token immediately using that booking) and **No, something else** (shows the normal reason picker).

Rules: one active token per child at a time. If the scanned code is no longer the clinic's (the doctor replaced it), "That check-in code isn't valid any more. Scan the QR code at reception again." and the camera reopens. Errors show as a toast.

PRINTABLE CHECK-IN QR (STAFF) /ADMIN/CHECK-IN-QR

A page that shows and prints the clinic's check-in QR as an A4 poster: clinic logo and name, "Scan to check in", a large QR code and two lines of instructions for parents. Buttons (not printed): **Print**, and for the doctor **Replace with a new code** (two taps; every old printout stops working). Opened from a QR icon in the doctor's Queue header.

6.6 Your queue: the token screen /queue (centrepiece)

Purpose: let the parent relax. The app tells them when to go in.

One big card per active token (a parent can have more than one child in the queue):

- **Coloured top half** (its colour follows the status): "AARAV'S TOKEN", the **giant token number**, and the reason (Vaccination / General checkup).
- **Bottom half:** a status pill, "**Now serving 12**", and one line of plain copy for the status:

Status	Colour	Copy shown
Waiting	teal	"3 patients ahead of you." / when 0: "You're next — please stay close by."
Called	coral	"It's your turn now — please go in."
In consultation	deep teal	"You're with the doctor now."
Skipped	amber	"You were skipped, please check with reception."
Completed	green	(the app jumps to the Visit summary automatically)
Removed	red	"This token was removed. Please check with reception." (then it leaves this screen)

- "Patients ahead" counts only waiting children with a lower token number. **There is no estimated wait time**, on purpose.
- Below: the install / notifications card, and a small note: "This screen updates on its own — no need to refresh."
- Empty: "No active token", "Check in to get today's token and follow the queue live. Summaries of finished visits are in Last visits.", with **Check in** and "Go to Last visits".
- Updates live; after the phone sleeps or goes offline, it catches up by itself.

6.7 Visit summary /visits/[id]

Opens **automatically** on whatever screen the parent is on when the doctor completes the visit (not when they open the app later). It can also be opened from Last visits.

- Card: child name, date and reason.
- **Total paid:** ₹ amount, large.
- **Follow-up visit** (if set): the date plus "we'll remind you beforehand."
- **Prescription:** photo thumbnails (up to 3) with "Tap a photo to zoom, download, or share it." With no photo: "No prescription photo was added for this visit."
- **Rating** (only if this parent has never rated): "How is this app working for you?" with 1–5 stars. Nothing else is asked, and it's asked once per parent, ever. Afterwards: "Thanks for rating the app".

PRESCRIPTION VIEWER (FULL SCREEN)

Black background, pinch-zoom and pan, Close, **Download**, and **Share** (the phone's share sheet, for example WhatsApp; only shown where the phone supports it). With several photos, the parent picks from thumbnails.

6.8 Last visits /records (tab)

- Title "Last visits", subtitle "Every finished visit, with the doctor's notes and prescriptions."
- **Filter chips** (scroll sideways): Child (All children / each child; only shown with 2+ children) and Reason (All reasons / Vaccination / General checkup), with a count such as "4 visits match".
- **Visit cards**, newest first: the child's initial in a circle, name, date, ₹ fee, a reason chip with an icon (syringe / stethoscope), a coral "Follow-up 12 Oct" chip if set, prescription thumbnails, and a **View visit summary** > row.
- Empty: "No visits yet". Filtered to nothing: "No visits match", with **Clear filters**.

6.9 Appointments /appointments (tab)

- Explainer under the title: "Booking a session doesn't skip the queue — check in when you arrive and you'll get a token as usual. **Bookings can't be changed once made.**"
- Cards: child name, day and session (for example "Wed, 1 Oct · Morning (10 am – 1 pm)"), reason, and a status pill (Booked / Arrived / Missed / Cancelled).
- **No cancel or reschedule buttons**: only the clinic can cancel.
- Pinned coral button: **Book an appointment**.
- Empty: "No upcoming appointments", "Book a session that suits you, up to a week ahead."

6.10 Book an appointment /appointments/book

Deliberately feels like check-in: **who** → **why** → **when**.

1. "Who is the appointment for?": child cards.
 2. "Reason for the visit": Vaccination / General checkup.
 3. **When**: pick a **day** (only days in the next 7 with an open session are shown), then a **session** (for example "Morning (10 am – 1 pm)", "Evening (6 pm – 9 pm)" or a custom time). A day where this child already has a booking shows "Already booked" and can't be picked. Sessions show **no capacity or slot counts**, and several children can book the same session.
 4. Pinned coral button: **Book appointment**. The booking is confirmed straight away (there's no approval step), with a toast such as "Booked for Wed, 1 Oct, Morning".
- If the doctor closes a session while the parent is looking at it: "That session was just closed. Please pick another."
 - No open sessions: "The doctor hasn't opened any sessions in the booking window yet. Please check again later, or come in and take a token."
 - No children: "Add your child first".

6.11 Know about your doctor /doctor

A profile page in a fixed order: **name** → **portrait photo** → **title and years of experience** → **clinic location** → **qualifications and languages spoken** → **areas of expertise** → **professional highlights**. Sections without data are hidden. Empty: "Doctor's profile coming soon".

6.12 Install, notifications and system overlays

INSTALL POPUP (EVERY VISIT IN A BROWSER TAB)

- "Install Pedi Clinic". On iPhone Safari it shows steps (Share → **Add to Home Screen**); on Android Chrome it shows an **Install app** button.
- Opened inside WhatsApp or another in-app browser: "Open this in your browser first", with **Copy link**.
- "Not now" hides it for this visit, leaving a small banner. It shows again after getting a token. It depends only on how the app was opened, not on the account: every browser tab shows it; the app opened from the home screen never does.
- Right after installing from the browser, a full-screen cover says: "App installed successfully! Please close this browser tab and open Pedi Clinic directly from your phone's home screen to continue." It has no close button.

NOTIFICATION PERMISSION (IN THE INSTALLED APP ONLY)

- A **soft modal**, at most once per visit, at helpful moments:
 - On Home: "Get live alerts when your turn is approaching"
 - After getting a token: "Want an alert when it's almost your turn?"
 - After booking: "Get reminded about this appointment"

Each has a short body, **Turn on** and **Not now**.

- After "Not now", a compact banner stays: **"Enable notifications for live queue alerts [Turn on]"** (in Home's bottom dock; at the top of other screens).
- If blocked: "Notifications are blocked", with phone-specific steps to re-enable (iPhone Settings → Notifications → Pedi Clinic; Android Settings → Apps → Pedi Clinic → Notifications).
- Once allowed or blocked, the modal and banner disappear for good.

NOTIFICATIONS LIST (BELL)

A sheet with the newest first: title, one-line body and time. Unread items are highlighted, each has a delete (bin) button, and tapping one goes to the relevant screen. Empty: "Nothing yet", "We'll let you know here when you're 3rd in line and when it's your turn." Everything that is pushed also lands here.

7. Doctor screens

7.1 Staff sign in /admin/login

"Staff sign in", with **Email**, **Password** and Sign in. The same screen serves the doctor and the pharmacist; the role decides where they land (Queue or Pharmacy feed).

7.2 Queue /admin/queue (home tab)

Purpose: run the day. The list updates live as parents check in.

Header: "Queue", with  **Search children** and + **Add walk-in** icon buttons.

EACH QUEUE CARD

- A **token number** tile; the **child's name**; **exact age** · **reason**.
- Pills: **status**, **New** or **Returning**, and an **Appointment** badge if they booked.
- Tapping the top of the card opens the *Child history* sheet.
- Actions depend on the status:

Status	Main button	Secondary buttons
Waiting	Call (notifies the parent "It's your turn")	Skip · Remove
Called	Start consultation	Recall (re-notifies) · Skip · Remove
In consultation	Complete visit (coral; opens the wizard)	Skip · Remove
Skipped	Recall (card sits at the end of the list)	Remove

Empty: "No one in the queue", "Tokens appear here the moment a parent checks in.", **Add walk-in**.

7.3 Add walk-in sheet

For parents without the app. Fields: **Child's name**, **Date of birth**, **Parent's mobile number** (10 digits), and **Reason for the visit** (Vaccination / General checkup). The note says: "The visit links to this number and appears in their app when they sign in." On success: "Token 14 created for Diya".

7.4 Search children sheet

A single field, **Name or phone number**, with live results (child, age, parent, phone). Tapping a result opens Child history. No match: "No matches", "Try a different spelling, or search by the parent's phone number."

7.5 Child history sheet

The header shows the child's name, age, **parent's name and a tap-to-call phone**. Then the **last visit summary first**, then the full history: date, reason, fee and prescription photos. New child: "First visit" / "No visits yet".

7.6 Complete visit: 5-step wizard sheet, one step per screen

1. **Prescription: Take photo** opens the rear camera. Up to **3 photos** ("Add another page"), each with a retake button; photos are compressed on the phone. Button: *Skip for now* (no photos) or *Next*.
2. **Fees**: three ₹ fields, **Consultation**, **Vaccination** and **Other** (any may be 0), with a live **Amount due** total. There are no preset or default fees.
3. **Payment** (skipped when the total is ₹0): choose **Cash**, **UPI**, **Card** or **Hybrid**. Hybrid asks for an amount per mode, which must add up *exactly* to the total ("Entered ₹... of ₹...").
4. **Follow-up** (optional): a future date, with a Clear button. It only schedules a reminder for the parent; it doesn't create an appointment.
5. **Review**: child, prescription count, each fee, each payment mode (or "No payment due") and the follow-up date, with a coral **Complete visit** button.

Back buttons on every step. Closing with anything entered asks: "Are you sure? Unsaved data will be lost.", with **Keep editing** / **Discard and close**. On complete, the visit appears instantly in the pharmacy feed, the parent's phone jumps to the summary, and the toast says "Visit completed for Aarav".

Only one child can be in consultation at a time. Calling another child while one is open asks the doctor to finish the current one first.

7.7 Appointments /admin/appointments

- Today and upcoming days, **grouped by day, then by session**.
- Each session shows a summary line, "3 booked · 2 vaccination, 1 general checkup", then each booking: child name, reason, age, parent name and a **tap-to-call** phone number.
- Actions: **Cancel session** and **Cancel day**, both two-tap ("Tap again — parents will be told"). Affected parents are notified immediately. There are no approve/reject buttons.
- Empty: "No sessions scheduled", "Open a session from the Availability tab." A session with no bookings: "No bookings yet".

7.8 History /admin/history

- "Patient history": only children whose consultation was **completed**.
- Defaults to **today** (updates live). Use < > to step a day, or a date box to jump to any past date.
- A **Reason** filter, and a search box, "Search child, parent or phone", that searches across all days.
- Rows: child, parent (or "Parent's name not given"), phone, and "General checkup · 3 visits" (last reason and visit count).
- Tapping a row opens the **patient timeline** (sheet): every consultation, newest first, with date, token, reason, a booked-appointment tag, **minutes with the doctor**, fees and how they were paid, follow-up, **medicines dispensed** (or "Not collected yet" / "Bought elsewhere"), and **View prescription**.
- Empty: "No consultations yet today" / "No one found" / "No one matches".

7.9 Notification /admin/notifications

The doctor's inbox, newest first. Mainly **"New appointment: Aarav"** with the reason and session, plus a "See all bookings" link to Appointments. Unread items stay highlighted for this visit, and each can be deleted. Empty: "No notifications", "When a parent books or moves an appointment, it shows up here."

7.10 Analytics /admin/analytics (doctor only)

Subtitle "Only you can see these numbers." A segmented switch toggles **End of day** and **Trends**. Every chart has a legend and a **Table** toggle to show the numbers, and tapping a column shows its value.

END OF DAY (PICK A DATE, DEFAULTS TO TODAY)

- Stat tiles: **Children seen**, **Total collected** (consultations + pharmacy), **Visit fees**, **Pharmacy sales** (with order count), **Appointments arrived**, **Appointments missed**.
- Fee tiles: Consultation / Vaccination / Other fees.
- Split bars: booked appointments attended vs missed; consultations by payment mode (Cash / UPI / Card); consultations by fee type.

TRENDS (RANGE: TODAY / 7 DAYS / 30 DAYS / CUSTOM; GROUP BY DAY, WEEK OR MONTH)

- Tiles: Children seen, Total collected, Visit fees, Pharmacy sales, **Average consultation** (minutes), **Skipped or removed** (x of y tokens), **Appointments kept**, **Follow-ups returned**.
- Column charts: children seen per day, week or month; consultation revenue split by fee type or payment mode; pharmacy sales; booked appointments attended vs missed.
- Split bars: reason for visit; new vs returning; how they joined the queue (same-day token vs booked appointment).
- **Busiest check-in hours**: tokens taken by hour of the day.
- Empty: "Nothing in this range yet".

Analytics must **not** show app ratings or install and notification adoption; those belong to the Owner only.

7.11 Availability /admin/availability

Purpose: open the sessions parents can book. Everything else stays open for walk-ins.

- Pick a **date**.
- **One-tap presets**: "Morning (10 am – 1 pm)" and "Evening (6 pm – 9 pm)" ("One tap adds it straight away."). A preset already open that day shows as added.
- **Or a custom time**: *From* and *To* boxes (number pad; typing "5" or "5:30" works) with an **AM/PM toggle** beside each, and a confirmation such as "Reads as 5:30 PM". An end time before the start shows "Must be after the start". There are no dropdowns and no slot counts.
- Helpers: **Copy last week** and **Mark day closed** (two-tap: "Tap again — booked parents will be told").
- The **session cards** for that day list every booked child with their reason, parent name and a tap-to-call number, plus **Cancel session**.
- Empty: "No sessions", "Nothing open on Wed, 1 Oct yet — use a button above."

8. Pharmacist screens

8.1 Pharmacy feed /admin/feed (home tab)

- A live list of **completed visits waiting for medicines**. A new one appears the moment the doctor completes a visit.
- Card: token number tile, child name, age · reason, and "2 prescription photos" (or "No prescription photo"). Tapping it opens Dispense.
- Empty: "Nothing waiting", "Visits appear here the moment the doctor completes them."

8.2 Dispense sheet

- Title: "Token 7 · Aarav".
- **Prescription photo(s)** at the top; they open full screen with pinch-zoom and pan.
- **Find a medicine**: search as you type. Each result shows name, unit, price and "12 left", with – / + quantity buttons (capped at the stock available).
- Footer: item count and a running ₹ **total**, a **Dispense** button (deducts stock in one safe step and is refused if stock ran out), and **"Buying elsewhere — skip"** (clears the visit from the feed).
- Toasts: "Dispensed — ₹340" / "Token 7 cleared".

8.3 Stock /admin/stock

- **Search medicines** and filter chips with counts: **All · In stock · Low stock · Out of stock**. Out-of-stock and low items sort to the top.
- A low-stock warning summary at the top when anything is low.
- Rows: name, unit, price per unit, quantity, a low or out badge, and a **Restock** button.
- **Add medicine** (sheet): Name, Unit ("tablet, ml, strip"), Price per unit, Quantity in stock, and **Warn below** ("You'll see a low-stock warning at or below this quantity.").
- **Restock** (sheet): **Quantity received** → "Paracetamol syrup now at 40".
- Empty: "No medicines yet", "Add what the pharmacy carries so visits can be dispensed."

The pharmacist cannot see fees, payments or analytics.

9. Owner screens

9.1 Team sign in /owner/login

"Team sign in", with Email and Password. Note: "This sign-in is for the Pedi Clinic team only. Clinic staff sign in at /admin." Doctor and pharmacist accounts are refused here.

9.2 Owner dashboard /owner

A single page that updates live:

- **App rating:** the average (for example 4.6 ★), the number of ratings, and a 5→1 star **distribution** bar chart. "Given by parents after a visit".
- **Adoption:** tiles for **Parents registered**, **Installed the app** (with % of parents) and **Notifications on** (with % of parents).
- **Usage:** "How tokens were created", a split bar of **From the app** vs **Walk-ins added by staff**.

10. Shared states, statuses and notifications

Visit / token statuses

Status	Meaning	Seen by
Waiting	Has a token, in line	Parent, Doctor
Called	The doctor tapped Call or Recall; the parent should go in	Parent, Doctor
In consultation	With the doctor now	Parent, Doctor
Completed	Visit saved; appears in the pharmacy feed and Last visits	All
Skipped	Passed over; can be recalled; moves to the end of the list	Parent, Doctor
Removed	Taken out of today's queue	Parent, Doctor

Appointment statuses

Status	Meaning
Booked	Confirmed as soon as it's made
Arrived	The child checked in with this booking
Missed	The day passed with no check-in (marked the next morning)
Cancelled	The clinic cancelled the session or day

"Awaiting approval" and "Not approved" exist in the code from an earlier approval flow that has since been removed. Don't design for them.

Notifications (push to the installed app, and always in the in-app list)

Notification	When	Goes to
"You're 3rd in line"	Exactly two waiting children ahead	Parent → Your queue
"Token N: it's your turn now"	Doctor taps Call or Recall	Parent → Your queue
"Token N was skipped" / "... removed from the queue"	Doctor taps Skip / Remove	Parent
"Follow-up due for Aarav"	2 days before the follow-up date, in the morning	Parent
"Appointment tomorrow for Aarav"	The evening before (7 pm)	Parent
"Appointment today for Aarav"	The morning of (8 am)	Parent
"Your appointment has been cancelled."	Doctor cancels a session or day	Parent
"New appointment: Aarav"	A parent books	Doctor (in-app inbox only)

Shared UI pieces to design once

- **Status pill** (six visit statuses, four appointment statuses)

- **Selectable option card** (child picker, reason picker, day and session picker), shared by check-in and booking so they feel the same
- **Sheet / drawer** with a title, a scrolling body and a pinned footer
- **Two-tap confirm button** for destructive actions ("Cancel session" → "Tap again to cancel")
- **Stat tile, chart card** (with Chart/Table toggle), **split bar, column chart**
- **Filter chip row** (scrolls sideways on phones)
- **Empty state, error state, skeletons, toast, offline banner**
- **Buttons:** primary (teal), accent (coral, the main action), secondary (outlined), ghost (text)
- **Prescription thumbnails** and the **full-screen photo viewer**

11. End-to-end flows

A. A typical visit (the demo path)

1. **Parent** opens the link → signs in with a phone number and code → enters their name → adds a child (name + date of birth).
2. Taps **Check in** → picks the child → picks *General checkup* → **Get token** → lands on **Your queue**: "Token 7 · 3 patients ahead of you". The notification prompt appears.
3. The queue moves; the parent gets a "**3rd in line**" push.
4. **Doctor** (Queue tab) taps **Call** on token 7 → the parent's card turns coral: "It's your turn now — please go in." → the doctor taps **Start consultation**.
5. The doctor taps **Complete visit** → photographs the prescription → fees ₹500 consultation → **Hybrid**: ₹300 UPI + ₹200 cash → follow-up in 2 weeks → **Complete visit**.
6. The **parent's** phone jumps to the **Visit summary**: prescription, ₹500 paid, follow-up date → they rate the app 5★.
7. **Pharmacist**: token 7 appears in the feed → opens it → zooms into the prescription → adds medicines → **Dispense** ("Dispensed — ₹340").
8. **Owner** dashboard: the rating and usage update live.

B. Booking ahead

1. Doctor → **Availability** → picks Thursday → taps "Morning (10 am – 1 pm)".
2. Parent → **Appointments** → **Book an appointment** → child → Vaccination → Thursday → Morning → **Book appointment** → "Booked".
3. Doctor gets "New appointment: Diya" in **Notification**; it appears under Thursday Morning in **Appointments**.
4. Wednesday 7 pm: "Appointment tomorrow". Thursday 8 am: "Appointment today".
5. Thursday: the parent taps **Check in** → gets a token as usual; the doctor's card shows the **Appointment** badge. Queue order is still first-come, first-served.
6. If they never arrive, the booking shows as **Missed** the next morning.

C. Walk-in without the app

1. Doctor → Queue → + **Add walk-in** → name, date of birth, parent's mobile, reason → a token is created.
2. Later the parent installs the app and signs in with the same number: the child and the visit are already there.

D. Doctor cancels a day

1. Doctor → Availability (or Appointments) → **Mark day closed** / **Cancel day** → "Tap again — booked parents will be told".
2. Every booked parent gets "Your appointment has been cancelled."; their booking shows **Cancelled**.

12. Do not add: things the app deliberately doesn't have

These were considered and left out on purpose. A design that includes them is off-brief.

PARENT SIDE

- Estimated wait time or ETA (only "patients ahead")
- Cancel, reschedule or edit a booking (only the clinic can cancel)
- Leaving the queue by themselves
- Symptom or complaint fields, free-text notes to the doctor
- Choosing a time slot inside a session, or seeing slot counts
- Online payment or payment in the app
- Rating the doctor, written reviews, feedback forms, Google review links
- Chat, calls or messaging with the clinic
- Vaccination charts, growth charts, health records beyond visits
- AI summaries, OCR of prescriptions
- Multiple clinics, multiple doctors, clinic search or maps
- Regional languages or a language switcher
- Social login or passwords for parents
- Profile photos for children

STAFF SIDE

- Approving or rejecting bookings (bookings are auto-confirmed)
- Session capacity or slot limits (sessions have no capacity)
- Urgent or priority flags that jump the queue
- Default or preset fee amounts
- Typing medicines at the consultation (the prescription is a photo; the pharmacist picks medicines)
- A clinic open or closed status banner
- Ratings or app adoption in the doctor's analytics
- Staff management, roles or settings screens
- Supplier, purchase-order or expiry tracking in stock
- Printing, invoices or GST bills

NOT BUILT YET (DON'T DESIGN UNLESS ASKED)

- Privacy notice / parental consent screen (needed before launch)
- Push notifications for the doctor (in-app inbox only today)

13. Ready-made prompts

Start with the main prompt, with this PDF attached. Then use the follow-up prompts one at a time, so the app is designed one part at a time.

MAIN PROMPT (PASTE FIRST)

Redesign "Pedi Clinic", an existing, working mobile app for a single pediatric clinic in India. The attached PDF is the source of truth for every screen, field, button, state and rule.

GOAL

Make it look like a modern, premium 2026 consumer app, the kind of polish you'd expect from Apple Health, Airbnb, Revolut or Headspace, while keeping it calm, warm and trustworthy for anxious parents with a sick child. It should feel modern and friendly, not clinical, not childish, not like an admin template.

KEEP EXACTLY (do not change)

- The same screens, navigation tabs, steps in each flow, data shown, and key button labels as described in the PDF.
- Do NOT add features, screens, fields or buttons that aren't in the PDF. Check against section 12 ("Do not add"). In particular: no estimated wait times, no chat, no online payment, no doctor ratings, no symptom pickers, no cancel/reschedule for parents, no slot counts.
- Words: "parent" and "child" (not "patient"), rupees (₹), English, Indian names and 10-digit numbers.

VISUAL DIRECTION (what "modern" means here)

- Typography-led: one contemporary geometric/rounded sans (e.g. Plus Jakarta Sans, Manrope, or Nunito), confident large headings, clear hierarchy, tabular numbers for tokens and money.
- Generous whitespace, fewer borders. Separate content with soft surfaces and spacing, not lines.
- Large rounded corners (20–28 px cards, pill-shaped buttons and chips), soft layered shadows, subtle depth.
- Palette: one calm primary (teal/blue family), ONE warm accent (coral) reserved only for the main action on each screen and the "It's your turn" moment, warm off-white background, near-black text. Subtle gradients allowed on hero elements only.
- Status colours must stay distinct and always carry a text label: Waiting, Called, In consultation, Completed, Skipped, Removed.
- Bento-style card layouts on dashboards and home; big tappable option cards for choices (child, reason, day, session). No dropdowns.
- Floating, slightly translucent bottom tab bar on phones; icon rail on tablets; sidebar on laptops.
- Clean outline icon set (Lucide style), friendly illustrated or icon-led empty states.
- Micro-interactions implied: smooth status colour transitions, gentle press states, a satisfying token "arrival" moment.

THE HERO SCREEN

The parent's "Your queue" token screen is the centrepiece. Give it a huge token number, a strong status colour, "Now serving", and one reassuring line ("3 children ahead of you"). It should feel like a boarding pass or a live-activity card: glanceable from arm's length.

NON-NEGOTIABLES

- Phone first (390 × 844), must also work on tablet and laptop.
- Touch targets ≥ 48 px, main action pinned to the bottom, secondary tasks open as sheets.
- Light AND dark versions.
- Every screen includes loading (skeleton), empty, and error states.

START WITH the parent app: Sign in, Home, Check in, Your queue (show Waiting, Called, In consultation and Skipped), and Visit summary. Then pause for my feedback before designing the rest.

FOLLOW-UP: REST OF THE PARENT APP

Continue in the same design system. Design the rest of the parent app from section 6: Add/Edit child sheet, Check in with the "same reason as your booking?" variant, Last visits with filter chips, Appointments, Book an appointment (who → why → day → session), Know about your doctor, the notifications list, the install popup (iPhone, Android, in-app browser), and the notification permission modal and banner.

FOLLOW-UP: DOCTOR

Same design system. Design the doctor's terminal from section 7, for phone AND laptop (sidebar). Queue cards in every status with their exact buttons, Add walk-in, Search, Child history, the 5-step Complete visit wizard (Photos → Fees → Payment incl. Hybrid split → Follow-up → Review), Appointments, History with patient timeline, Notification inbox, Analytics (End of day and Trends: clean modern charts with a Table toggle), and Availability. Six destinations. On phones you may group some under "More", but Queue stays first. This is a working tool: prioritise speed and scanability over decoration.

FOLLOW-UP: PHARMACIST AND OWNER

Same design system. Design the pharmacist console (Feed, Dispense sheet, Stock with filters, Add medicine, Restock) and the owner dashboard from sections 8–9. Phone and tablet.

IF THE TOOL STARTS INVENTING THINGS

Remove anything not described in the PDF. Keep only the screens, fields and buttons it lists.

Tips

- If the tool won't take a PDF, paste the section of this document for the screens you're asking about below the prompt.
- If a design looks too plain, add: "*push the visual quality further — more depth, bolder type, more polish.*" If it looks too playful, add: "*more restrained and premium.*"
- Pick the direction you like and then say "*use this as the design system for all remaining screens*". That keeps the four roles consistent.
